

SOV/68-59-1-16/26

Conference on the Widening of Resources of Coking Coals in the
Kuznetskiy Basin

with a total output of 51.1 million t/year should be in operation). Further developments in the Kuznetskiy Basin are in regions which contain mainly high ash and difficult-to-beneficiate coals. In the existing mines also some increase in the ash and moisture content is expected. Therefore, in new coal beneficiation plants, only wet treatment methods without preliminary separation into size fractions should be considered.

K.K. Kollodiy (Kuzbassugleobogashcheniye Trust) reported on methods of increasing the efficiency of coal beneficiation processes in existing coal beneficiation works in the Kuznetskiy Basin. Of 28 operating washeries, 21 are operating with the pneumatic method, 4 by a combination of pneumatic and wet process and 3 by wet method. During the last 5 years, the ash content of coals has increased by 2.1% and that of concentrates by 0.4%. In order to decrease the ash content in concentrates, secondary wet treatment of pneumatically cleaned coals was introduced on some plants. This decreased the ash content by 0.3% and increased the yield of concentrates by

Card6/8

SOV/68-59-1-16/26

Conference on the Widening of Resources of Coking Coals in the
Kuznetskiy Basin

1.5-2.5%. A cascade scheme of beneficiation was developed on pneumatically operating plants consisting of the fact that not individual-size fractions 6-10, 13-50 mm are treated in pneumatic separators USh-3 but 0-50 mm fraction. For jigging dust-containing coals 10-0 mm a synthetic bedding layer from heavy rubber was developed instead of felspar which was found to be very efficient.

A.A. Lukyanin (VUKHIN) in a paper "A Decrease in the Consumption of Coals K and K₁ on the Kuznetskiy Metallurgical Combine by Incorporating Into Blends Gas Coals" pointed out that coke ovens in the Urals and Siberia are designed for a standardised heating condition calculated for a coking period of 13-14 hours instead of 17 hours. Temperatures in the control flues 1 390 - 1 410°C. With increasing proportion of high-shrinkage coals, the quality of coke deteriorates. An increase in the coking period is impossible due to a shortage of coking capacity. Experimental work on coking indicated that it is possible to decrease the proportion of K coals but for this purpose, the existing technology of coal preparation and

Card7/8

TABLE I BOOK INFORMATION		607/AM
Automation in Manufacturing Plants + Manufacturing Processess (Automation of Mechanical Manufacturing Processes in Manufacturing Industry) Reson,		
Reson, 1979. 359 p. Illustrations allby Inserted. 3,000 copies printed.		
General Ed.: I.M. Rabinovitz; Resenver: N.V. Kostylevich, Candidate of Technical Sciences; Resenver: D.S. Tsvetkov, Candidate of Technical Sciences; Sov. Sci. Res. Inst. of Production Reses. (V.I. Kurnikov and M.A. Chirko), Tech. Ed.; O.P. Gerasimov, Managing Ed., Sov. Institute on Machine-Building Technology (Engineering Division, Resen), Yu. V. Kuznetsov, Engineer.		
PURPOSE: This book is intended for technical personnel.		
CONTENTS: The book deals with the automation of mechanical manufacturing processes in small-batch production in industrial industry. The use of hydraulics serving slide tools is explained, and practical experience in the introduction of operating slide tools into industrial plants is described. The improvements of such slide tools, their technical and economic characteristics resulting from their usage, and methods of designing newer ones are discussed. For designs of hydraulic slide tools are described. Examples in last two problems of programs control, especially for the simplest control systems and a number of the original systems are described. No recommendations are mentioned. There are 37 references! by Resen and 12 English.

TITLE: Some physicochemical properties of rare earth silicides

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 1, no. 10, 1965, 1772-1777

TOPIC TAGS: rare earth metal, silicide, hardness, high temperature oxidation, oxidation kinetics

ABSTRACT: The microhardness and high-temperature oxidation resistance of scandium, yttrium, lanthanum, cerium, praseodymium, and neodymium silicides were studied. In all cases, the microhardness is found to change with the load up to a certain value of the latter, beyond which the microhardness changed to a negligible extent. This pattern confirms an earlier hypothesis according to which the microhardness varies with the load employed. The microhardness was found to be lowest in phases rich in silicon. This is explained by the prevalence of covalent bonds between the silicon atoms over M-Si and M-M bonds, which causes a marked asymmetry in the electron density distribution and a corresponding drop in hardness. This asymmetry also causes the appearance of semiconducting properties in lanthanum disilicide and cerium disilicide. The greatest hardness and brittleness are displayed by rare earth

monosilicides. Analysis of the data on the oxidation kinetics of rare earth silicides and on the temperature dependence of the rate of their oxidation showed that the oxidation is a complex process involving several elementary components the interaction of which varies appreciably with changes in temperature and time. Scandium silicides have the greatest and cerium silicides the lowest oxidation resistance. Orig. art. has: 5 figures and 4 tables.

TITLE: Producing silicides of rare metals by arc smelting

SOURCE: AN SSSR. Izvestiya. Metally, no. 6, 1965, 62-68

TOPIC TAGS: silicide, rare metal alloy, silicon alloy, scandium, yttrium,
lanthanum, cerium, praseodymium, neodymium
alloy, metal chemical analysis, x-ray analysisABSTRACT: The formation of silicides of rare metals by arc smelting was experimentally investigated by alloying Si(99.9% pure) with Sc(97% pure), Y(95%), La(97.9%), Ce(98%), Pr, and Nd in different ratios and by performing x-ray phase and chemical analyses on the resulting alloys. Tables of the initial compositions and the final phase compositions of the various alloys are presented. It was found that to obtain the pure silicidic phase no excess of either component (over the stoichiometric ratio) was necessary for the Sc-Si system, while a 1.5--2.0% excess of Si was necessary for the Y, Pr, and Nd-Si systems and a 2--3% Si excess for the La and Ce-Si systems. Homogenization of the alloys for 5--7 hours in a high vacuum (10^{-5} mm kg) is recommended at 1600K for Sc and Y alloys and at 1370--1570K for

TOPIC TAGS: rare earth element, scandium, yttrium, lanthanum, cerium, silicide

ABSTRACT: The paper describes a study of the possibility of synthesizing silicides of rare-earth elements by fusing their initial components in an arc furnace in an inert atmosphere as well as by reducing the rare earth element oxides with silicon in vacuo. On the basis of this research, conditions are established for obtaining mono- and disilicides of scandium, yttrium, lanthanum, and cerium. The x-ray phase analysis of the elements has been carried out at the Department of Inorganic

ORG: Kiev Institute of Problems in Material Science (Kiyevskiy Institut Problem materialovedeniya)

TITLE: High-temperature oxidation of some rare earth-metal silicides

SOURCE: Zhurnal fizicheskoy khimii, v. 40, no. 9, 1966, 2250-2254

TOPIC TAGS: rare earth metal, silicide, lanthanum silicide, scandium silicide, yttrium silicide, cerium silicide, silicide oxidation, SCANDIUM, YTTRIUM, LANTHANUM, CERIUM, METAL OXIDATION

ABSTRACT: The oxidation behavior of the scandium, yttrium, lanthanum and cerium silicides in air at 300–1100°C has been studied. Silicide specimens 99.9%-pure were prepared by powder-metallurgy methods. Scandium silicides, especially monosilicide ($ScSi$), were found to be the most oxidation resistant. A dense oxide film on scandium monosilicide begins to form at 500°C. The film tightly adheres to the base. Only at 1100°C does the film lose its protective ability. The lower silicide $ScSi_3$ and the higher silicide Sc_3Si_5 behave similarly, but the former begins to oxidize at 300°C, the latter at 700°C, and the oxide films of both lose protective ability at 900°C. The yttrium, lanthanum and cerium silicides have low oxidation resistance. A loosening of oxide films and rapid oxidation in all these silicides begins at 300–700°C. Orig. art. has: 2 tables. [DV]

Title : The Effect of Ultrasonic Waves upon the Superficially Located Adenosine Polyphosphotase (Ectoapirase) of Nucleic Erythrocytes.

Orig Pub : Dokl. AN SSSR, 1957, 113, No 2, 323-325

Abstract : Erythrocytes (E) were isolated from heparinized blood of pigeons; after the plasma was washed off, the erythrocytes were suspended in a 1.14 percent NaCl solution, and subjected to ultrasonic wave treatment. As the ultrasonic (US) source, a piezo-quartz plate of 5 cm in diameter was used. In order to determine the activity of the ferment,

0.01 ml of densely centrifugated E were incubated with 0.001 M ATP [adenosine-triphosphate] in the presence of 0.001 M of $MgCl_2$ at $37^\circ C$ and of pH 8 (barbital buffer). The ability of E to split off phosphate from ATP was determined by accumulation of anorganic phosphate during the period of 10 minutes. Osmotic E resistability of pigeons was lower than of rabbits and rats. It became even lower within the US field: 15-20 seconds after the sound treatment, hemolysis of nucleic E took place. Ectoapirase (I) activity of E in pigeons rose to its maximum after 5-7 seconds. After 15 seconds, however, it became less active than I activity of intact E. Ferments were not discovered in the isotonic solution, which surrounds E. $CdCl_2$ (0.00001 M), which blocks hydrosulfurous groups, decreased I activity. When 0.001 M of cysteine was added, I activity was again restored.

I activity rose under the influence of US waves, even
then when it was considerably inhibited by CdCl₂.
Apparently, new fermentation centers are "bared" under
the influence of US waves, and some of them are sensitive
to thionic poisons. -- A.D. Beloborodova.

TITLE: Macromolecular structure of high-polymer (ribosomal) ribonucleic acid

PERIODICAL: Biokhimiya, v. 27, no. 3. 1962, 387-402

TEXT: RNA of *E. coli* was studied by means of sedimentation, viscosity, UV absorption, optical rotation, UV electric dichroism measurements and electron microscopy. In its physical and physico-chemical properties it resembles closely the native TMV RNA studied earlier. The macrostructural organization of high-polymer TMV RNA resembles that of *E. coli* ribosomal RNA. Each macromolecule constitutes one continuous polynucleotide chain. The configuration in solution is governed by the free equilibrium resulting from the reversible interaction of intramolecular forces (hydrogen bonds, electrostatic repulsion and probably coordinate links involving metals). At room temperature and at a sufficient ionic strength, short mainly adjacent sections of the single-stranded polynucleotide chain interact with each other in pairs by means of hydrogen bonds forming short double-stranded DNA-like helical regions stabilized by hydrogen bonds (secondary structure). As a whole, RNA macromolecules can be found in different configurations, depending on ionic strength, temperature and: a) an unfolded strand without any secondary structure; b) a compact rod formed by linear piling of numerous short helical regions orderly oriented and alternating with

Card 1/2

Macromolecular structure of...

8/218/62-027/003/001/005

random chain regions, c) a compact coil made up from the non-oriented helical and random regions. All these configurations are interrelated with each other by free reversible transitions. There are 9 figures and 35 references.

Title : Appraisal of water-oil bearing beds in cased wells by
the gamma-neutron radioactivity logging method

Periodical : Neft. khoz., v. 33, #11, 59-62, N 1955

Abstract : The author gives examples taken from measurements in the
Tuymazy oil field of successful determination of the water,
water-oil and oil layers in casing collars, when measured
in the cased well by the gamma-neutron radioactivity
logging method and properly analysing and interpreting
the secondary gamma radiation. In order to diminish
errors, he suggests increasing the diameter of the
radioactivity logging depth instrument and advocates
further research to improve the accuracy of those instru-
ments and to develop methods of more accurate interpretation
of radioactivity logs. Charts, 4 references, 1952.

Udarnaya sverchitza: shornik s'etery po ispol'stveniyu radioaktivnykh ischenii
 1. Isotopy v gidrogeologicheskikh issledovaniyakh (Radioactive Isotopes in Petroleum Geophysical Investigations). Collection of Articles on the Use of Radioactive Radiation and Isotopes in Petroleum Geophysics. Moscow, Gostoptekhnizdat, 1959. 370 p. Errata slip inserted. 4,000 copies printed.

Ed.: P.A. Alabeyev, Professor; Doctor of Geological and Mineralogical Sciences!

Rev.: Ed.: A.P. Kalmakov; Tech. Ed.: A.S. Polozina.
 NOTE: This book is intended for petroleum geologists, geochemists and scientists engaged in geological research who are interested in radiometric techniques of petroleum prospecting.

CONTENTS: The collection contains 20 articles compiled by staff members and scientists of the Laboratory for Nuclear Geology and Geochemistry of the Petroleum Institute (one the Institute for Nuclear Geology and Mineral Metal Processing) of the Academy of Sciences USSR, the Laboratory for Radiometry in the Institute of All-Russia Scientific Research Institute of Geophysics and the Institute of Geophysics of the All-Russia Scientific Research Institute of Geophysics and the Institute of Geophysics of the All-Russia Scientific Research Institute for Petroleum enterprises. The articles treat for planning research projects for petroleum enterprises, describe radioactive materials or radioactive surveys in petroleum geology, describe radioactive instruments (counters, etc.) for radioactive neutron and gamma rays, give the results of research with models of rock strata, introduce fundamental principles of a new method for determining radioactivity in the analysis of rock samples from petroleum reservoirs, problems of bore hole logging of rock samples from petroleum reservoirs, measurements in bore holes in the study and interpretation of radiometric measurements in bore holes are reviewed, as well as the results of studies in the monoliths of petroleum and water in a stratum. Finally, a new method of surveying the movement of petroleum is described. No personnel of the surface of a prospective petroleum deposit is described. No personnel of the surface are mentioned. Radioactive Isotopes and Nuclear (Cont.)

SOV/5592
107

Tech. Ed.: A. S. Polosina.

PURPOSE : The book is intended for engineers and technicians dealing with the problems involved in the application of radioactive isotopes and nuclear radiation.

COVERAGE: This collection of 39 articles is Vol. 4 of the Transactions of the All-Union Conference of the Introduction of Radioactive Isotopes and Nuclear Reactions in the National Economy of the USSR. The Conference was called by the Gosudarstvennyy nauchno-tekhnicheskiy komitet Sovet Ministrov SSSR (State Scientific-Technical Committee of the Council of Ministers of the USSR), Academy of Sciences USSR, Gosplan SSSR (State Planning Committee of the Council of Ministers of the USSR), Gosudarstvennyy komitet Svetla Ministrov SSSR po avtomatizatsii i mashinostroyeniyu (State Committee of the Council of Ministers of the USSR for Automation and Machine Building), and the Council of Ministers of the Latvian SSR. The reports summarized in this publication deal with the advantages, prospects, and

development of radioactive methods used in prospecting, surveying, and mining of ores. Individual reports present the results of the latest scientific research on the development and improvement of the theory, methodology, and technology of radiometric investigations. Application of radioactive methods in the field of engineering geology, hydrology, and the control of ore enrichment processes is analyzed. No personalities are mentioned. There are no references.

TABLE OF CONTENTS:

Aleksayev, F. A. Present State and Future Prospects of Applying the Methods of Nuclear Geophysics in Prospecting, Surveying, and Mining of Minerals	5
Bulashovich, Yu. P., G. N. Voskoboinikov, and L. V. Muzyukin. Neutron and Gamma-Ray Logging at Ore and Coal Deposits	19
Gordyeyev, Yu. I., A. A. Mukher, and D. M. Srebrcdol'skiy. The
